## Cisco Nexus 92300YC

## **Overview**

## Overview of installation and configuration for Cisco Nexus 92300YC switches

Before configuring Cisco Nexus 92300YC switches, review the procedure overview.

To initially configure a Cisco Nexus 92300YC switch on systems running ONTAP, follow these steps:

- Complete Cisco Nexus 92300YC cabling worksheet. The sample cabling worksheet provides examples of recommended port assignments from the switches to the controllers. The blank worksheet provides a template that you can use in setting up your cluster.
- 2. Configure the Cisco Nexus 92300YC switch. Set up and configure the Cisco Nexus 92300YC switch.
- Prepare to install NX-OS software and Reference Configuration File (RCF). Prepare for installing the NX-OS software and the Reference Configuration File (RCF).
- 4. Install the NX-OS software. Install the NX-OS software on the Nexus 92300YC switch. NX-OS is a network operating system for the Nexus series of Ethernet switches and MDS series of Fibre Channel (FC) storage area network switches provided by Cisco Systems.
- 5. Install the Reference Configuration File (RCF). Install the RCF after setting up the Nexus 92300YC switch for the first time. You can also use this procedure to upgrade your RCF version.
- 6. Install the Cluster Switch Health Monitor (CSHM) configuration file. Install the applicable configuration file for cluster switch health monitoring of Nexus 92300YC cluster switches.

#### Additional information

Before you begin installation or maintenance, be sure to review the following:

- Configuration requirements
- · Components and part numbers
- · Required documentation
- Smart Call Home requirements

### Configuration requirements for Cisco Nexus 92300YC switches

For Cisco Nexus 92300YC switch installation and maintenance, be sure to review all configuration and network requirements.

If you want to build ONTAP clusters with more than two nodes, you need two supported cluster network switches. You can use additional management switches, which are optional.

#### **Configuration requirements**

To configure your cluster, you need the appropriate number and type of cables and cable connectors for your switches. Depending on the type of switch you are initially configuring, you need to connect to the switch console port with the included console cable; you also need to provide specific network information.

#### **Network requirements**

You need the following network information for all switch configurations:

- IP subnet for management network traffic
- · Host names and IP addresses for each of the storage system controllers and all applicable switches
- Most storage system controllers are managed through the e0M interface by connecting to the Ethernet service port (wrench icon). On AFF A800 and AFF A700 systems, the e0M interface uses a dedicated Ethernet port.

Refer to the Hardware Universe for latest information.

#### Components for Cisco Nexus 92300YC switches

For Cisco Nexus 92300YC switch installation and maintenance, be sure to review all switch components and part numbers. See the Hardware Universe for details.

The following table lists the part number and description for the 92300YC switch, fans, and power supplies:

Part number	Description
190003	Cisco 92300YC, CLSW, 48Pt10/25GB, 18Pt100G, PTSX (PTSX = Port Side Exhaust)
190003R	Cisco 92300YC, CLSW, 48Pt10/25GB, 18Pt100G, PSIN (PSIN = Port Side Intake)
X-NXA-FAN-35CFM-B	Fan, Cisco N9K port side intake airflow
X-NXA-FAN-35CFM-F	Fan, Cisco N9K port side exhaust airflow
X-NXA-PAC-650W-B	Power supply, Cisco 650W - port side intake
X-NXA-PAC-650W-F	Power supply, Cisco 650W - port side exhaust

Cisco Nexus 92300YC switch airflow details:

- Port-side exhaust airflow (standard air) Cool air enters the chassis through the fan and power supply modules in the cold aisle and exhausts through the port end of the chassis in the hot aisle. Port-side exhaust airflow with blue coloring.
- Port-side intake airflow (reverse air) Cool air enters the chassis through the port end in the cold aisle and exhausts through the fan and power supply modules in the hot aisle. Port-side intake airflow with burgundy coloring.

### **Documentation requirements for Cisco Nexus 92300YC switches**

For Cisco Nexus 92300YC switch installation and maintenance, be sure to review all the recommended documentation.

#### **Switch documentation**

To set up the Cisco Nexus 92300YC switches, you need the following documentation from the Cisco Nexus 9000 Series Switches Support page:

Document title	Description
Nexus 9000 Series Hardware Installation Guide	Provides detailed information about site requirements, switch hardware details, and installation options.
Cisco Nexus 9000 Series Switch Software Configuration Guides (choose the guide for the NX-OS release installed on your switches)	Provides initial switch configuration information that you need before you can configure the switch for ONTAP operation.
Cisco Nexus 9000 Series NX-OS Software Upgrade and Downgrade Guide (choose the guide for the NX-OS release installed on your switches)	Provides information on how to downgrade the switch to ONTAP supported switch software, if necessary.
Cisco Nexus 9000 Series NX-OS Command Reference Master Index	Provides links to the various command references provided by Cisco.
Cisco Nexus 9000 MIBs Reference	Describes the Management Information Base (MIB) files for the Nexus 9000 switches.
Nexus 9000 Series NX-OS System Message Reference	Describes the system messages for Cisco Nexus 9000 series switches, those that are informational, and others that might help diagnose problems with links, internal hardware, or the system software.
Cisco Nexus 9000 Series NX-OS Release Notes (choose the notes for the NX-OS release installed on your switches)	Describes the features, bugs, and limitations for the Cisco Nexus 9000 Series.
Regulatory Compliance and Safety Information for Cisco Nexus 9000 Series	Provides international agency compliance, safety, and statutory information for the Nexus 9000 series switches.

#### **ONTAP** systems documentation

To set up an ONTAP system, you need the following documents for your version of the operating system from the ONTAP 9 Documentation Center.

Name	Description
Controller-specific Installation and Setup Instructions	Describes how to install NetApp hardware.

Name	Description
ONTAP documentation	Provides detailed information about all aspects of the ONTAP releases.
Hardware Universe	Provides NetApp hardware configuration and compatibility information.

#### Rail kit and cabinet documentation

To install a Cisco Nexus 92300YC switch in a NetApp cabinet, see the following hardware documentation.

Name	Description
42U System Cabinet, Deep Guide	Describes the FRUs associated with the 42U system cabinet, and provides maintenance and FRU replacement instructions.
[Install a Cisco Nexus 92300YC switch in a NetApp Cabinet	Describes how to install a Cisco Nexus 92300YC switch in a four-post NetApp cabinet.

#### **Smart Call Home requirements**

To use Smart Call Home feature, review the following guidelines.

Smart Call Home monitors the hardware and software components on your network. When a critical system configuration occurs, it generates an email-based notification and raises an alert to all the recipients that are configured in your destination profile. To use Smart Call Home, you must configure a cluster network switch to communicate using email with the Smart Call Home system. In addition, you can optionally set up your cluster network switch to take advantage of Cisco's embedded Smart Call Home support feature.

Before you can use Smart Call Home, be aware of the following considerations:

- · An email server must be in place.
- The switch must have IP connectivity to the email server.
- The contact name (SNMP server contact), phone number, and street address information must be configured. This is required to determine the origin of messages received.
- A CCO ID must be associated with an appropriate Cisco SMARTnet Service contract for your company.
- Cisco SMARTnet Service must be in place for the device to be registered.

The Cisco support site contains information about the commands to configure Smart Call Home.

## Install hardware

## Complete Cisco Nexus 92300YC cabling worksheet

If you want to document the supported platforms, download a PDF of this page and complete the cabling worksheet.

The sample cabling worksheet provides examples of recommended port assignments from the switches to the controllers. The blank worksheet provides a template that you can use in setting up your cluster.

## Sample cabling worksheet

The sample port definition on each pair of switches is as follows:

Cluster switch A		Cluster switch B	
Switch port	Node and port usage	Switch port	Node and port usage
1	10/25 GbE node	1	10/25 GbE node
2	10/25 GbE node	2	10/25 GbE node
3	10/25 GbE node	3	10/25 GbE node
4	10/25 GbE node	4	10/25 GbE node
5	10/25 GbE node	5	10/25 GbE node

## Configure the Cisco Nexus 92300YC switch

Follow this procedure to set up and configure the Cisco Nexus 92300YC switch.

#### Steps

- 1. Connect the serial port to a host or serial port.
- 2. Connect the management port (on the non-port side of the switch) to the same network where your SFTP server is located.
- 3. At the console, set the host side serial settings:
  - · 9600 baud
  - 8 data bits
  - 1 stop bit
  - o parity: none
  - flow control: none
- 4. When booting for the first time or rebooting after erasing the running configuration, the Nexus 92300YC switch loops in a boot cycle. Interrupt this cycle by typing **yes** to abort Power on Auto Provisioning.

The System Admin Account setup is displayed.

```
$ VDC-1 %$ %POAP-2-POAP_INFO: - Abort Power On Auto Provisioning [yes - continue with normal setup, skip - bypass password and basic configuration, no - continue with Power On Auto Provisioning] (yes/skip/no)[no]: y
Disabling POAP.....Disabling POAP
2019 Apr 10 00:36:17 switch %$ VDC-1 %$ poap: Rolling back, please wait... (This may take 5-15 minutes)

---- System Admin Account Setup ----
Do you want to enforce secure password standard (yes/no) [y]:
```

5. Type **y** to enforce secure password standard:

```
Do you want to enforce secure password standard (yes/no) [y]: \mathbf{y}
```

6. Enter and confirm the password for user admin:

```
Enter the password for "admin":
Confirm the password for "admin":
```

7. Type **yes** to enter the Basic System Configuration dialog.

#### Show example

This setup utility will guide you through the basic configuration of the system. Setup configures only enough connectivity for management of the system.

Please register Cisco Nexus9000 Family devices promptly with your supplier. Failure to register may affect response times for initial service calls. Nexus9000 devices must be registered to receive entitled support services.

Press Enter at anytime to skip a dialog. Use ctrl-c at anytime to skip the remaining dialogs.

Would you like to enter the basic configuration dialog (yes/no):

8. Create another login account:

```
Create another login account (yes/no) [n]:
```

9. Configure read-only and read-write SNMP community strings:

```
Configure read-only SNMP community string (yes/no) [n]:

Configure read-write SNMP community string (yes/no) [n]:
```

10. Configure the cluster switch name:

```
Enter the switch name : cs2
```

11. Configure the out-of-band management interface:

```
Continue with Out-of-band (mgmt0) management configuration? (yes/no)
[y]: y

Mgmt0 IPv4 address: 172.22.133.216

Mgmt0 IPv4 netmask: 255.255.224.0

Configure the default gateway? (yes/no) [y]: y

IPv4 address of the default gateway: 172.22.128.1
```

12. Configure advanced IP options:

```
Configure advanced IP options? (yes/no) [n]: n
```

13. Configure Telnet services:

```
Enable the telnet service? (yes/no) [n]: n
```

14. Configure SSH services and SSH keys:

```
Enable the ssh service? (yes/no) [y]: y

Type of ssh key you would like to generate (dsa/rsa) [rsa]: rsa

Number of rsa key bits <1024-2048> [1024]: 2048
```

#### 15. Configure other settings:

```
Configure the ntp server? (yes/no) [n]: n

Configure default interface layer (L3/L2) [L2]: L2

Configure default switchport interface state (shut/noshut) [noshut]: noshut

Configure CoPP system profile (strict/moderate/lenient/dense) [strict]: strict
```

#### 16. Confirm switch information and save the configuration:

```
Would you like to edit the configuration? (yes/no) [n]: n

Use this configuration and save it? (yes/no) [y]: y

[] 100%

Copy complete, now saving to disk (please wait)...

Copy complete.
```

#### What's next?

Prepare to install NX-OS software and RCF.

## Review cabling and configuration considerations

Before configuring your Cisco 92300YC switch, review the following considerations.

#### Support for NVIDIA CX6, CX6-DX, and CX7 Ethernet ports

If connecting a switch port to an ONTAP controller using NVIDIA ConnectX-6 (CX6), ConnectX-6 Dx (CX6-DX), or ConnectX-7 (CX7) NIC ports, you must hard-code the switch port speed.

```
(cs1) (config) # interface Ethernet1/19
For 100GbE speed:
(cs1) (config-if) # speed 100000
For 40GbE speed:
(cs1) (config-if) # speed 40000
(cs1) (config-if) # no negotiate auto
(cs1) (config-if) # exit
(cs1) (config) # exit
Save the changes:
(cs1) # copy running-config startup-config
```

See the Hardware Universe for more information on switch ports.

## **Configure software**

#### Prepare to install NX-OS software and Reference Configuration File (RCF)

Before you install the NX-OS software and the Reference Configuration File (RCF), follow this procedure.

#### What you'll need

- A fully functioning cluster (no errors in the logs or similar issues).
- Appropriate software and upgrade guides, which are available from Cisco Nexus 9000 Series Switches.

#### About the examples

The examples in this procedure use two nodes. These nodes use two 10GbE cluster interconnect ports e0a and e0b. See the Hardware Universe to verify the correct cluster ports on your platforms.

The examples in this procedure use the following switch and node nomenclature:

- The names of the two Cisco switches are cs1 and cs2.
- The node names are node1 and node2.
- The cluster LIF names are node1\_clus1 and node1\_clus2 for node1 and node2\_clus1 and node2\_clus2 for node2.
- The cluster1::\*> prompt indicates the name of the cluster.

#### About this task

The procedure requires the use of both ONTAP commands and Cisco Nexus 9000 Series Switches commands; ONTAP commands are used unless otherwise indicated. The command outputs might vary depending on different releases of ONTAP.

#### Steps

1. Change the privilege level to advanced, entering **y** when prompted to continue:

```
set -privilege advanced
```

The advanced prompt (\*>) appears.

2. If AutoSupport is enabled on this cluster, suppress automatic case creation by invoking an AutoSupport message:

```
system node autosupport invoke -node * -type all -message MAINT=xh
```

where *x* is the duration of the maintenance window in hours.

The AutoSupport message notifies technical support of this maintenance task so that automatic case creation is suppressed during the maintenance window.

The following command suppresses automatic case creation for two hours:

```
cluster1:> **system node autosupport invoke -node * -type all -message
MAINT=2h**
```

3. Display how many cluster interconnect interfaces are configured in each node for each cluster interconnect switch: network device-discovery show -protocol cdp

#### Show example

Node/	Local	Discovered		
Protocol	Port	Device (LLDP: ChassisID)	Interface	
Platform				
				-
node2	/cdp			
	e0a	cs1	Eth1/2	N9K-
C92300YC				
	e0b	cs2	Eth1/2	N9K-
C92300YC				
node1	/cdp			
	e0a	cs1	Eth1/1	N9K-
C92300YC				
	e0b	cs2	Eth1/1	N9K-
C92300YC				

- 4. Check the administrative or operational status of each cluster interface.
  - a. Display the network port attributes: network port show -ipspace Cluster

Node: nod	le2						
						Speed(Mbps)	
Health							
Port	IPspace	Broadcast	Domain	Link	MTU	Admin/Oper	
Status							
	Cluster	Clustor		1170	0000	auto/10000	
eoa healthy	Cluster	Cluster		up	9000	aut0/10000	
_	Cluster	Cluster		1110	9000	auto/10000	
healthy	0100001	0100001		ωÞ	3000	4455, 15555	
_							
Node: nod	le1						
						Speed(Mbps)	
Health							
Port	IPspace	Broadcast	Domain	Link	MTU	Admin/Oper	
Status							
	Cluster	Clustor		1170	9000	auto/10000	
eoa healthy	Clustel	Clustel		up	9000	aut0/10000	
_	Cluster	Cluster		เมาว	9000	auto/10000	
healthy	320001	0_0000		~	2000	1.000, 10000	

b. Display information about the LIFs:  ${\tt network}$  interface show -vserver Cluster

		Logical	Status	Network	Current
Current	Is				
Vserver		Interface	Admin/Oper	Address/Mask	Node
Port	Home	Э			
Cluster					
		node1_clus1	l up/up	169.254.209.69/16	node1
e0a	true				
		node1_clus2	2 up/up	169.254.49.125/16	node1
e0b	true	_			
		node2_clus1	l up/up	169.254.47.194/16	node2
e0a	true	_			
		node2_clus2	2 up/up	169.254.19.183/16	node2
e0b	true	9			

## 5. Ping the remote cluster LIFs:

cluster ping-cluster -node node-name

```
cluster1::*> cluster ping-cluster -node node2
Host is node2
Getting addresses from network interface table...
Cluster node1 clus1 169.254.209.69 node1
                                             e0a
Cluster node1 clus2 169.254.49.125 node1
                                             e0b
Cluster node2 clus1 169.254.47.194 node2
                                             e0a
Cluster node2 clus2 169.254.19.183 node2
                                             e0b
Local = 169.254.47.194 169.254.19.183
Remote = 169.254.209.69 169.254.49.125
Cluster Vserver Id = 4294967293
Ping status:
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
Detected 9000 byte MTU on 4 path(s):
    Local 169.254.19.183 to Remote 169.254.209.69
    Local 169.254.19.183 to Remote 169.254.49.125
    Local 169.254.47.194 to Remote 169.254.209.69
    Local 169.254.47.194 to Remote 169.254.49.125
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

6. Verify that the auto-revert command is enabled on all cluster LIFs:

network interface show -vserver Cluster -fields auto-revert

7. For ONTAP 9.4 and later, enable the cluster switch health monitor log collection feature for collecting switch-related log files using the commands:

 $\verb|system| cluster-switch| log| setup-password| \verb|and| system| cluster-switch| log| enable-collection|$ 

```
cluster1::*> system cluster-switch log setup-password
Enter the switch name: <return>
The switch name entered is not recognized.
Choose from the following list:
cs1
cs2
cluster1::*> system cluster-switch log setup-password
Enter the switch name: cs1
RSA key fingerprint is
e5:8b:c6:dc:e2:18:18:09:36:63:d9:63:dd:03:d9:cc
Do you want to continue? {y|n}::[n] y
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system cluster-switch log setup-password
Enter the switch name: cs2
RSA key fingerprint is
57:49:86:a1:b9:80:6a:61:9a:86:8e:3c:e3:b7:1f:b1
Do you want to continue? {y|n}:: [n] y
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system cluster-switch log enable-collection
Do you want to enable cluster log collection for all nodes in the
cluster?
{y|n}: [n] y
Enabling cluster switch log collection.
cluster1::*>
```

If any of these commands return an error, contact NetApp support.

#### What's next?

Install the NX-OS software.

#### Install the NX-OS software

Follow this procedure to install the NX-OS software on the Nexus 92300YC switch.

NX-OS is a network operating system for the Nexus series of Ethernet switches and MDS series of Fibre Channel (FC) storage area network switches provided by Cisco Systems.

#### **Review requirements**

#### Supported ports and node connections

- The Inter-Switch Links (ISLs) supported for the Nexus 92300YC switches are ports 1/65 and 1/66.
- The node connections supported for the Nexus 92300YC switches are ports 1/1 through 1/66.

#### What you'll need

- Applicable NetApp Cisco NX-OS software for your switches from the NetApp Support Site, available from mysupport.netapp.com
- A fully functioning cluster (no errors in the logs or similar issues).
- Cisco Ethernet switch page. Consult the switch compatibility table for the supported ONTAP and NX-OS versions.

#### Install the software

The examples in this procedure use two nodes, but you can have up to 24 nodes in a cluster.

#### About the examples

The examples in this procedure use the following switch and node nomenclature:

- The Nexus 92300YC switch names are cs1 and cs2.
- The example used in this procedure starts the upgrade on the second switch, \*cs2\*.
- The cluster LIF names are node1\_clus1 and node1\_clus2 for node1, and node2\_clus1 and node2\_clus2 for node2.
- The IPspace name is Cluster.
- The cluster1::\*> prompt indicates the name of the cluster.
- The cluster ports on each node are named e0a and e0b.

See the *Hardware Universe*^ for the actual cluster ports supported on your platform.

#### Steps

- 1. Connect the cluster switch to the management network.
- 2. Use the ping command to verify connectivity to the server hosting the NX-OS software and the RCF.

This example verifies that the switch can reach the server at IP address 172.19.2.1:

```
cs2# ping 172.19.2.1
Pinging 172.19.2.1 with 0 bytes of data:

Reply From 172.19.2.1: icmp_seq = 0. time= 5910 usec.
```

3. Copy the NX-OS software and EPLD images to the Nexus 92300YC switch.

```
cs2# copy sftp: bootflash: vrf management
Enter source filename: /code/nxos.9.2.2.bin
Enter hostname for the sftp server: 172.19.2.1
Enter username: user1
Outbound-ReKey for 172.19.2.1:22
Inbound-ReKey for 172.19.2.1:22

```
1 SUP Success

EPLDs upgraded.

Module 1 EPLD upgrade is successful.
```

8. After the switch reboot, log in again and verify that the new version of EPLD loaded successfully.

#### Show example

cs2# *show version mod	aute i epia^	
EPLD Device	Version	
 MI FPGA	0x7	
IO FPGA	0x19	
MI FPGA2	0x2	
GEM FPGA	0x2	

#### What's next?

Install the Reference Configuration File

## **Install the Reference Configuration File (RCF)**

You can install the RCF after setting up the Nexus 92300YC switch for the first time. You can also use this procedure to upgrade your RCF version.

#### About this task

The examples in this procedure use the following switch and node nomenclature:

- The names of the two Cisco switches are cs1 and cs2.
- The node names are node1 and node2.
- The cluster LIF names are node1\_clus1, node1\_clus2, node2\_clus1, and node2\_clus2.
- The cluster1::\*> prompt indicates the name of the cluster.

- Before you perform this procedure, make sure that you have a current backup of the switch configuration.
- No operational inter-switch link (ISL) is needed during this procedure. This is by design because RCF version changes can affect ISL connectivity temporarily. To ensure non-disruptive cluster operations, the following procedure migrates all of the cluster LIFs to the operational partner switch while performing the steps on the target switch.

#### Steps

1. Display the cluster ports on each node that are connected to the cluster switches: network devicediscovery show

#### Show example

Node/	Local	Discovered		
Protocol	Port	Device (LLDP: ChassisID)	Interface	
Platform				
node1/cdp				
	e0a	cs1	Ethernet1/1/1	N9K-
C92300YC				
	e0b	cs2	Ethernet1/1/1	N9K-
C92300YC				
node2/cdp				
	e0a	cs1	Ethernet1/1/2	N9K-
C92300YC				
	e0b	cs2	Ethernet1/1/2	N9K-
C92300YC				

- 2. Check the administrative and operational status of each cluster port.
  - a. Verify that all the cluster ports are up with a healthy status: network port show -ipspace Cluster

```
cluster1::*> *network port show -ipspace Cluster*
Node: node1
Ignore
                                  Speed (Mbps)
Health Health
Port IPspace Broadcast Domain Link MTU Admin/Oper
Status Status
______
_____
eOc Cluster Cluster up 9000 auto/100000
healthy false
e0d Cluster Cluster up 9000 auto/100000
healthy false
Node: node2
Ignore
                                  Speed (Mbps)
Health Health
Port IPspace Broadcast Domain Link MTU Admin/Oper
Status Status
_____ ____
_____
     Cluster Cluster up 9000 auto/100000
healthy false
e0d Cluster Cluster up 9000 auto/100000
healthy false
cluster1::*>
```

b. Verify that all the cluster interfaces (LIFs) are on the home port: network interface show -vserver Cluster

	I	Logical	Status	Network	
Current		Current Is			
Vserver	]	Interface	Admin/Oper	Address/Mask	Node
Port	Home				
Cluster					
	r	node1_clus1	up/up	169.254.3.4/23	node1
e0c	true				
	r	node1_clus2	up/up	169.254.3.5/23	node1
e0d	true				
	r	node2_clus1	up/up	169.254.3.8/23	node2
e0c	true				
	r	node2_clus2	up/up	169.254.3.9/23	node2
e0d	true				

c. Verify that the cluster displays information for both cluster switches: system cluster-switch show -is-monitoring-enabled-operational true

```
cluster1::*> *system cluster-switch show -is-monitoring-enabled
-operational true*
                           Type Address
Switch
Model
                           cluster-network 10.233.205.92

                   9.3(4)
    Version Source: CDP
2 entries were displayed.
```

Disable auto-revert on the cluster LIFs.

```
cluster1::*> network interface modify -vserver Cluster -lif * -auto
-revert false
```

4. On cluster switch cs2, shut down the ports connected to the cluster ports of the nodes.

```
cs2(config)# interface e1/1-64
cs2(config-if-range)# shutdown
```

5. Verify that the cluster ports have migrated to the ports hosted on cluster switch cs1. This might take a few seconds. network interface show -vserver Cluster

```
cluster1::*> *network interface show -vserver Cluster*
        Logical
                 Status Network
                                            Current
Current Is
Vserver Interface Admin/Oper Address/Mask Node
Port Home
----- -----
Cluster
        node1 clus1 up/up 169.254.3.4/23 node1

     true
        node1 clus2 up/up 169.254.3.5/23 node1
e0c
     false
        node2 clus1 up/up 169.254.3.8/23
                                           node2
e0c true
        node2 clus2 up/up 169.254.3.9/23
                                            node2
e0c
     false
cluster1::*>
```

6. Verify that the cluster is healthy: cluster show

# Show example

7. If you have not already done so, save a copy of the current switch configuration by copying the output of the following command to a text file:

```
show running-config
```

8. Clean the configuration on switch cs2 and perform a basic setup.

When updating or applying a new RCF, you must erase the switch settings and perform basic configuration. You must be connected to the switch serial console port to set up the switch again.

a. Clean the configuration:

```
(cs2)# write erase
Warning: This command will erase the startup-configuration.
Do you wish to proceed anyway? (y/n) [n] y
```

b. Perform a reboot of the switch:

# Show example

```
(cs2)# {\bf reload} Are you sure you would like to reset the system? (y/n) {\bf y}
```

9. Copy the RCF to the bootflash of switch cs2 using one of the following transfer protocols: FTP, TFTP, SFTP, or SCP. For more information on Cisco commands, see the appropriate guide in the Cisco Nexus 9000 Series Switches guides.

This example shows TFTP being used to copy an RCF to the bootflash on switch cs2:

```
cs2# copy tftp: bootflash: vrf management
Enter source filename: /code/Nexus_92300YC_RCF_v1.0.2.txt
Enter hostname for the tftp server: 172.19.2.1
Enter username: user1

Outbound-ReKey for 172.19.2.1:22
Inbound-ReKey for 172.19.2.1:22
user1@172.19.2.1's password:
tftp> progress
Progress meter enabled
tftp> get /code/Nexus_92300YC_RCF_v1.0.2.txt /bootflash/nxos.9.2.2.bin
/code/Nexus_92300YC_R 100% 9687 530.2KB/s 00:00
tftp> exit
Copy complete, now saving to disk (please wait)...
Copy complete.
```

10. Apply the RCF previously downloaded to the bootflash.

For more information on Cisco commands, see the appropriate guide in the Cisco Nexus 9000 Series Switches guides.

```
cs2# copy Nexus 92300YC RCF_v1.0.2.txt running-config echo-commands
Disabling ssh: as its enabled right now:
generating ecdsa key(521 bits).....
generated ecdsa key
Enabling ssh: as it has been disabled
 this command enables edge port type (portfast) by default on all
interfaces. You
 should now disable edge port type (portfast) explicitly on switched
ports leading to hubs,
 switches and bridges as they may create temporary bridging loops.
Edge port type (portfast) should only be enabled on ports connected to a
single
host. Connecting hubs, concentrators, switches, bridges, etc... to
this
 interface when edge port type (portfast) is enabled, can cause
temporary bridging loops.
Use with CAUTION
Edge Port Type (Portfast) has been configured on Ethernet1/1 but will
only
have effect when the interface is in a non-trunking mode.
. . .
Copy complete, now saving to disk (please wait)...
Copy complete.
```

11. Verify on the switch that the RCF has been merged successfully:

show running-config

```
cs2# show running-config
!Command: show running-config
!Running configuration last done at: Wed Apr 10 06:32:27 2019
!Time: Wed Apr 10 06:36:00 2019

  Nexus 92300YC Reference Configuration File (RCF) v1.0.2 (10-19-2018)
  Ports 1/1 - 1/48: 10GbE Intra-Cluster Node Ports
  Ports 1/49 - 1/64: 40/100GbE Intra-Cluster Node Ports
  Ports 1/65 - 1/66: 40/100GbE Intra-Cluster ISL Ports
```

When applying the RCF for the first time, the **ERROR: Failed to write VSH commands** message is expected and can be ignored.

12. Verify that the RCF file is the correct newer version: show running-config

When you check the output to verify you have the correct RCF, make sure that the following information is correct:

- The RCF banner
- The node and port settings
- Customizations

The output varies according to your site configuration. Check the port settings and refer to the release notes for any changes specific to the RCF that you have installed.

13. After you verify the RCF versions and switch settings are correct, copy the running-config file to the startup-config file.

For more information on Cisco commands, see the appropriate guide in the Cisco Nexus 9000 Series Switches guides.

```
cs2# copy running-config startup-config
[] 100% Copy complete
```

14. Reboot switch cs2. You can ignore the "cluster ports down" events reported on the nodes while the switch reboots.

```
cs2# reload This command will reboot the system. (y/n)? [n] \bf y
```

- 15. Verify the health of the cluster ports on the cluster.
  - a. Verify that e0d ports are up and healthy across all nodes in the cluster: network port show
     –ipspace Cluster

```
cluster1::*> *network port show -ipspace Cluster*
Node: node1
Ignore
                                  Speed (Mbps)

Port IPspace Broadcast Domain Link MTU Admin/Oper
Status Status
_____ ____
_____
e0a Cluster Cluster up 9000 auto/10000
healthy false
e0b Cluster Cluster up 9000 auto/10000
healthy false
Node: node2
Ignore
                                  Speed (Mbps)
Health Health
Port IPspace Broadcast Domain Link MTU Admin/Oper
Status Status
______ ______
_____
     Cluster Cluster up 9000 auto/10000
healthy false
e0b Cluster Cluster up 9000 auto/10000
healthy false
```

b. Verify the switch health from the cluster (this might not show switch cs2, since LIFs are not homed on e0d).

Show example		

cluster1::\*> \*network device-discovery show -protocol cdp\* Node/ Local Discovered Protocol Port Device (LLDP: ChassisID) Interface Platform \_\_\_\_\_\_ \_\_\_\_\_ \_\_\_\_\_ node1/cdp e0a cs1 Ethernet1/1 N9K-C92300YC e0b cs2 Ethernet1/1 N9K-C92300YC node2/cdp Ethernet1/2 e0a cs1 N9K-C92300YC Ethernet1/2 e0b cs2 N9K-C92300YC cluster1::\*> \*system cluster-switch show -is-monitoring-enabled -operational true\* Type Address Switch Model cluster-network 10.233.205.90 cs1 N9K-C92300YC Serial Number: FOXXXXXXXGD Is Monitored: true Reason: None Software Version: Cisco Nexus Operating System (NX-OS) Software, Version 9.3(4) Version Source: CDP cs2 cluster-network 10.233.205.91 N9K-C92300YC Serial Number: FOXXXXXXXGS Is Monitored: true Reason: None Software Version: Cisco Nexus Operating System (NX-OS) Software, Version 9.3(4) Version Source: CDP 2 entries were displayed.

You might observe the following output on the cs1 switch console depending on the RCF version previously loaded on the switch

```
2020 Nov 17 16:07:18 cs1 %$ VDC-1 %$ %STP-2-

UNBLOCK_CONSIST_PORT: Unblocking port port-channel1 on

VLAN0092. Port consistency restored.

2020 Nov 17 16:07:23 cs1 %$ VDC-1 %$ %STP-2-BLOCK_PVID_PEER:

Blocking port-channel1 on VLAN0001. Inconsistent peer vlan.

2020 Nov 17 16:07:23 cs1 %$ VDC-1 %$ %STP-2-BLOCK_PVID_LOCAL:

Blocking port-channel1 on VLAN0092. Inconsistent local vlan.
```

16. On cluster switch cs1, shut down the ports connected to the cluster ports of the nodes.

The following example uses the interface example output from step 1:

```
cs1(config)# interface e1/1-64
cs1(config-if-range)# shutdown
```

17. Verify that the cluster LIFs have migrated to the ports hosted on switch cs2. This might take a few seconds.

network interface show -vserver Cluster

# Show example

	Logical	Status	Network	Current
Current	Is			
Vserver	Interface	Admin/Oper	Address/Mask	Node
Port	Home			
Cluster				
	node1_clus1	up/up	169.254.3.4/23	node1
e0d	false			
	node1_clus2	up/up	169.254.3.5/23	node1
e0d	true			
	node2_clus1	up/up	169.254.3.8/23	node2
e0d	false			
	node2_clus2	up/up	169.254.3.9/23	node2
e0d	true			

18. Verify that the cluster is healthy: cluster show

- 19. Repeat Steps 7 to 14 on switch cs1.
- 20. Enable auto-revert on the cluster LIFs.

```
cluster1::*> network interface modify -vserver Cluster -lif * -auto
-revert True
```

21. Reboot switch cs1. You do this to trigger the cluster LIFs to revert to their home ports. You can ignore the "cluster ports down" events reported on the nodes while the switch reboots.

```
cs1# reload This command will reboot the system. (y/n)? [n] {\bf y}
```

22. Verify that the switch ports connected to the cluster ports are up.

23. Verify that the ISL between cs1 and cs2 is functional: show port-channel summary

24. Verify that the cluster LIFs have reverted to their home port: network interface show -vserver Cluster

# Show example

```
cluster1::*> *network interface show -vserver Cluster*

### For ONTAP 9.8 and later

For ONTAP 9.8 and later, enable the cluster switch health monitor log collection feature for collecting switch-related log files, using the commands: system switch ethernet log setup-password and system switch ethernet log enable-collection

Enter: system switch ethernet log setup-password

```
cluster1::*> system switch ethernet log setup-password
Enter the switch name: <return>
The switch name entered is not recognized.
Choose from the following list:
cs1
cs2
cluster1::*> system switch ethernet log setup-password
Enter the switch name: cs1
RSA key fingerprint is e5:8b:c6:dc:e2:18:18:09:36:63:d9:63:dd:03:d9:cc
Do you want to continue? {y|n}::[n] y
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system switch ethernet log setup-password
Enter the switch name: cs2
RSA key fingerprint is 57:49:86:a1:b9:80:6a:61:9a:86:8e:3c:e3:b7:1f:b1
Do you want to continue? {y|n}:: [n] y
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
```

Followed by: system switch ethernet log enable-collection

```
cluster1::*> system switch ethernet log enable-collection

Do you want to enable cluster log collection for all nodes in the cluster?
{y|n}: [n] y

Enabling cluster switch log collection.

cluster1::*>
```

### For ONTAP 9.4 and later

For ONTAP 9.4 and later, enable the cluster switch health monitor log collection feature for collecting switch-related log files using the commands:

 $\verb|system| cluster-switch| log| setup-password| \verb|and| system| cluster-switch| log| enable-collection|$ 

Enter: system cluster-switch log setup-password

```
cluster1::*> system cluster-switch log setup-password
Enter the switch name: <return>
The switch name entered is not recognized.
Choose from the following list:
cs1
cs2
cluster1::*> system cluster-switch log setup-password
Enter the switch name: cs1
RSA key fingerprint is e5:8b:c6:dc:e2:18:18:09:36:63:d9:63:dd:03:d9:cc
Do you want to continue? {y|n}::[n] y
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system cluster-switch log setup-password
Enter the switch name: cs2

{y|n}: [n] y

Enabling cluster switch log collection.

cluster1::*>
```

# **Ethernet Switch Health Monitoring log collection**

The Ethernet switch health monitor (CSHM) is responsible for ensuring the operational health of Cluster and Storage network switches and collecting switch logs for debugging purposes. This procedure guides you through the process of setting up and starting the collection of detailed **Support** logs from the switch and starts an hourly collection of **Periodic** data that is collected by AutoSupport.

# **Steps**

1. To set up log collection, run the following command for each switch. You are prompted to enter the switch name, username, and password for log collection.

```
system switch ethernet log setup-password
```

# Show example

```
cluster1::*> system switch ethernet log setup-password
Enter the switch name: <return>
The switch name entered is not recognized.
Choose from the following list:
cs1
cs2
cluster1::*> system switch ethernet log setup-password
Enter the switch name: cs1
Would you like to specify a user other than admin for log
collection? {y|n}: n
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system switch ethernet log setup-password
Enter the switch name: cs2
Would you like to specify a user other than admin for log
collection? {y|n}: n
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
```

2. To start log collection, run the following command, replacing DEVICE with the switch used in the previous command. This starts both types of log collection: the detailed **Support** logs and an hourly collection of

### Periodic data.

system switch ethernet log modify -device <switch-name> -log-request true

# Show example

cluster1::\*> system switch ethernet log modify -device cs1 -log
-request true

Do you want to modify the cluster switch log collection configuration?  $\{y|n\}$ : [n]  $\mathbf{y}$ 

Enabling cluster switch log collection.

cluster1::\*> system switch ethernet log modify -device cs2 -log
-request true

Do you want to modify the cluster switch log collection configuration?  $\{y \mid n\}$ : [n]  $\mathbf{y}$ 

Enabling cluster switch log collection.

Wait for 10 minutes and then check that the log collection completes:

system switch ethernet log show

If any of these commands return an error or if the log collection does not complete, contact NetApp support.

# **Troubleshoot**

If you encounter any of the following error statuses reported by the log collection feature (visible in the output of system switch ethernet log show), try the corresponding debug steps:

Log collection error status	Resolution
RSA keys not present	Regenerate ONTAP SSH keys. Contact NetApp support.
switch password error	Verify credentials, test SSH connectivity, and regenerate ONTAP SSH keys. Review switch documentation or contact NetApp support for instructions.
ECDSA keys not present for FIPS	If FIPS mode is enabled, ECDSA keys need to be generated on the switch before retrying.

pre-existing log found	Remove the previous log collection file on the switch.
switch dump log error	Ensure the switch user has log collection permissions. Refer to the prerequisites above.

# **Configure SNMPv3**

Follow this procedure to configure SNMPv3, which supports Ethernet switch health monitoring (CSHM).

# About this task

The following commands configure an SNMPv3 username on Cisco 92300YC switches:

- For no authentication: snmp-server user <code>SNMPv3\_USER</code> NoAuth
- For MD5/SHA authentication: snmp-server user SNMPv3\_USER auth [md5|sha] AUTH-PASSWORD
- For MD5/SHA authentication with AES/DES encryption: snmp-server user SNMPv3\_USER AuthEncrypt auth [md5|sha] AUTH-PASSWORD priv aes-128 PRIV-PASSWORD

The following command configures an SNMPv3 username on the ONTAP side: cluster1::\*> security login create -user-or-group-name SNMPv3\_USER -application snmp -authentication -method usm -remote-switch-ipaddress ADDRESS

The following command establishes the SNMPv3 username with CSHM: cluster1::\*> system switch ethernet modify -device DEVICE -snmp-version SNMPv3 -community-or-username SNMPv3\_USER

# **Steps**

1. Set up the SNMPv3 user on the switch to use authentication and encryption:

show snmp user

```
(sw1) (Config) # snmp-server user SNMPv3User auth md5 <auth_password>
priv aes-128 <priv password>
(sw1) (Config) # show snmp user
                    SNMP USERS
           Auth Priv(enforce) Groups
User
acl filter
______ ____
_____
admin
                aes-128(no)
                      des(no) network-admin
           md5
           md5
SNMPv3User
                                 network-operator
   NOTIFICATION TARGET USERS (configured for sending V3 Inform)
______
User
           Auth
                        Priv
(sw1) (Config) #
```

# 2. Set up the SNMPv3 user on the ONTAP side:

security login create -user-or-group-name <username> -application snmp -authentication-method usm -remote-switch-ipaddress 10.231.80.212

```
cluster1::*> system switch ethernet modify -device "sw1
(b8:59:9f:09:7c:22)" -is-monitoring-enabled-admin true
cluster1::*> security login create -user-or-group-name <username>
-application snmp -authentication-method usm -remote-switch
-ipaddress 10.231.80.212
Enter the authoritative entity's EngineID [remote EngineID]:
Which authentication protocol do you want to choose (none, md5, sha,
sha2-256)
[none]: md5
Enter the authentication protocol password (minimum 8 characters
long):
Enter the authentication protocol password again:
Which privacy protocol do you want to choose (none, des, aes128)
[none]: aes128
Enter privacy protocol password (minimum 8 characters long):
Enter privacy protocol password again:
```

3. Configure CSHM to monitor with the new SNMPv3 user:

system switch ethernet show-all -device "sw1" -instance

```
cluster1::*> system switch ethernet show-all -device "sw1" -instance
                                   Device Name: sw1
                                    IP Address: 10.231.80.212
                                  SNMP Version: SNMPv2c
                                 Is Discovered: true
   SNMPv2c Community String or SNMPv3 Username: cshm1!
                                  Model Number: N9K-C92300YC
                                Switch Network: cluster-network
                              Software Version: Cisco Nexus
Operating System (NX-OS) Software, Version 9.3(7)
                     Reason For Not Monitoring: None <---- displays
when SNMP settings are valid
                      Source Of Switch Version: CDP/ISDP
                                Is Monitored ?: true
                   Serial Number of the Device: QTFCU3826001C
                                   RCF Version: v1.8X2 for
Cluster/HA/RDMA
cluster1::*>
cluster1::*> system switch ethernet modify -device "sw1" -snmp
-version SNMPv3 -community-or-username <username>
cluster1::*>
```

4. Verify that the serial number to be queried with the newly created SNMPv3 user is the same as detailed in the previous step after the CSHM polling period has completed.

system switch ethernet polling-interval show

```
cluster1::*> system switch ethernet polling-interval show
         Polling Interval (in minutes): 5
cluster1::*> system switch ethernet show-all -device "sw1" -instance
                                   Device Name: sw1
                                    IP Address: 10.231.80.212
                                  SNMP Version: SNMPv3
                                 Is Discovered: true
   SNMPv2c Community String or SNMPv3 Username: SNMPv3User
                                  Model Number: N9K-C92300YC
                                Switch Network: cluster-network
                              Software Version: Cisco Nexus
Operating System (NX-OS) Software, Version 9.3(7)
                     Reason For Not Monitoring: None <---- displays
when SNMP settings are valid

# Migrate switches

# Migrate to a two-node switched cluster with a Cisco Nexus 92300YC switch

If you have an existing two-node *switchless* cluster environment, you can migrate to a two-node *switched* cluster environment using Cisco Nexus 92300YC switches to enable you to scale beyond two nodes in the cluster.

The procedure you use depends on whether you have two dedicated cluster-network ports on each controller or a single cluster port on each controller. The process documented works for all nodes using optical or twinax ports, but is not supported on this switch if nodes are using onboard 10Gb BASE-T RJ45 ports for the cluster-network ports.

Most systems require two dedicated cluster-network ports on each controller.

After your migration completes, you might need to install the required configuration file to support the Cluster Switch Health Monitor (CSHM) for 92300YC cluster switches. See Install the Cluster Switch Health Monitor (CSHM).

# **Review requirements**

# What you'll need

For a two-node switchless configuration, ensure that:

- The two-node switchless configuration is properly set up and functioning.
- The nodes are running ONTAP 9.6 and later.
- All cluster ports are in the up state.
- All cluster logical interfaces (LIFs) are in the **up** state and on their home ports.

For the Cisco Nexus 92300YC switch configuration:

- · Both switches have management network connectivity.
- · There is console access to the cluster switches.
- Nexus 92300YC node-to-node switch and switch-to-switch connections use twinax or fiber cables.

Hardware Universe - Switches contains more information about cabling.

- Inter-Switch Link (ISL) cables are connected to ports 1/65 and 1/66 on both 92300YC switches.
- Initial customization of both the 92300YC switches are completed. So that the:
  - 92300YC switches are running the latest version of software
  - Reference Configuration Files (RCFs) are applied to the switches Any site customization, such as SMTP, SNMP, and SSH is configured on the new switches.

# Migrate the switch

# About the examples

The examples in this procedure use the following cluster switch and node nomenclature:

- The names of the 92300YC switches are cs1 and cs2.
- The names of the cluster SVMs are node1 and node2.
- The names of the LIFs are node1\_clus1 and node1\_clus2 on node 1, and node2\_clus1 and node2\_clus2 on node 2 respectively.
- The cluster1::\*> prompt indicates the name of the cluster.
- The cluster ports used in this procedure are e0a and e0b.

Hardware Universe contains the latest information about the actual cluster ports for your platforms.

# Step 1: Prepare for migration

1. Change the privilege level to advanced, entering y when prompted to continue:

```
set -privilege advanced
```

The advanced prompt (\*>) appears.

2. If AutoSupport is enabled on this cluster, suppress automatic case creation by invoking an AutoSupport message:

system node autosupport invoke -node \* -type all -message MAINT=xh

where x is the duration of the maintenance window in hours.

The AutoSupport message notifies technical support of this maintenance task so that automatic case creation is suppressed during the maintenance window.

# Show example

The following command suppresses automatic case creation for two hours:

```
cluster1::*> system node autosupport invoke -node * -type all
-message MAINT=2h
```

# Step 2: Configure cables and ports

1. Disable all node-facing ports (not ISL ports) on both the new cluster switches cs1 and cs2.

You must not disable the ISL ports.

# Show example

The following example shows that node-facing ports 1 through 64 are disabled on switch cs1:

```
cs1# config
Enter configuration commands, one per line. End with CNTL/Z.
cs1(config)# interface e/1-64
cs1(config-if-range)# shutdown
```

2. Verify that the ISL and the physical ports on the ISL between the two 92300YC switches cs1 and cs2 are up on ports 1/65 and 1/66:

```
show port-channel summary
```

The following example shows that the ISL ports are up on switch cs1:

+ The following example shows that the ISL ports are up on switch cs2:

+

3.	Display	the	list	of	neighb	orina	devices:

show cdp neighbors

This command provides information about the devices that are connected to the system.

The following example lists the neighboring devices on switch cs1:

+ The following example lists the neighboring devices on switch cs2:

+

```
Capability Codes: R - Router, T - Trans-Bridge, B - Source-Route-Bridge

S - Switch, H - Host, I - IGMP, r - Repeater,
V - VoIP-Phone, D - Remotely-Managed-Device,
s - Supports-STP-Dispute

Device-ID Local Intrfce Hldtme Capability Platform
Port ID
cs1(FD0220329KU) Eth1/65 177 R S I s N9K-C92300YC
Eth1/65
cs1(FD0220329KU) Eth1/66 177 R S I s N9K-C92300YC
Eth1/66

Total entries displayed: 2
```

4. Verify that all cluster ports are up:

network port show -ipspace Cluster

Each port should display up for Link and healthy for Health Status.

# Show example

Node: nod	e1						
						Speed(Mbps)	Health
Port	IPspace	Broadcast	Domain	Link	MTU		
e0a healthy	Cluster	Cluster		up	9000	auto/10000	
_	Cluster	Cluster		up	9000	auto/10000	
Node: nod	e2						
Port	IPspace	Broadcast	Domain	Link	MTU	Speed(Mbps) Admin/Oper	
e0a healthy	Cluster	Cluster		up	9000	auto/10000	
_	Cluster	Cluster		up	9000	auto/10000	

# 5. Verify that all cluster LIFs are up and operational:

network interface show -vserver Cluster

Each cluster LIF should display true for Is Home and have a Status Admin/Oper of up/up

```
cluster1::*> network interface show -vserver Cluster
        Logical Status Network Current

6. Verify that auto-revert is enabled on all cluster LIFs:

network interface show -vserver Cluster -fields auto-revert

# Show example

7. Disconnect the cable from cluster port e0a on node1, and then connect e0a to port 1 on cluster switch cs1, using the appropriate cabling supported by the 92300YC switches.

The Hardware Universe - Switches contains more information about cabling.

- 8. Disconnect the cable from cluster port e0a on node2, and then connect e0a to port 2 on cluster switch cs1, using the appropriate cabling supported by the 92300YC switches.
- 9. Enable all node-facing ports on cluster switch cs1.

# Show example

The following example shows that ports 1/1 through 1/64 are enabled on switch cs1:

```
csl# config
Enter configuration commands, one per line. End with CNTL/Z.
csl(config)# interface e1/1-64
csl(config-if-range)# no shutdown
```

10. Verify that all cluster LIFs are up, operational, and display as true for Is Home:

network interface show -vserver Cluster

# Show example

The following example shows that all of the LIFs are up on node1 and node2 and that Is Home results are true:

	Logical	Status	Network	Current	
Current	Is				
Vserver Home	Interface	Admin/Oper	Address/Mask	Node	Port
					-
Cluster					
true	node1_clus1	up/up	169.254.209.69/16	node1	e0a
	node1_clus2	up/up	169.254.49.125/16	node1	e0b
true	node2_clus1	up/up	169.254.47.194/16	node2	e0a
true	node2 clus2	up/up	169.254.19.183/16	node2	e0b
true	_	-			

11. Display information about the status of the nodes in the cluster:

```
cluster show
```

# Show example

The following example displays information about the health and eligibility of the nodes in the cluster:

- 12. Disconnect the cable from cluster port e0b on node1, and then connect e0b to port 1 on cluster switch cs2, using the appropriate cabling supported by the 92300YC switches.
- 13. Disconnect the cable from cluster port e0b on node2, and then connect e0b to port 2 on cluster switch cs2, using the appropriate cabling supported by the 92300YC switches.
- 14. Enable all node-facing ports on cluster switch cs2.

# Show example

The following example shows that ports 1/1 through 1/64 are enabled on switch cs2:

```
cs2# config
Enter configuration commands, one per line. End with CNTL/Z.
cs2(config)# interface e1/1-64
cs2(config-if-range)# no shutdown
```

# Step 3: Verify the configuration

1. Verify that all cluster ports are up:

```
network port show -ipspace Cluster
```

The following example shows that all of the cluster ports are up on node1 and node2:

Node: no	de1						
Ignore							
Health						Speed (Mbps)	Health
	IPspace	Broadcast	Domain	Link	MTU	Admin/Oper	Status
	Cluster	Cluster		up	9000	auto/10000	
e0b healthy	Cluster false	Cluster		up	9000	auto/10000	
Node: no	de2						
Ignore						Speed(Mbps)	Health
Health Port Status	IPspace	Broadcast	Domain	Link	MTU	Admin/Oper	Status
e0a healthy	Cluster false	Cluster		up	9000	auto/10000	
e0b healthy	Cluster false	Cluster		up	9000	auto/10000	

# 2. Verify that all interfaces display true for Is Home:

network interface show -vserver Cluster

This might take several minutes to complete.

The following example shows that all LIFs are up on node1 and node2 and that Is Home results are true:

	Status	Network	Current	
S				
Interface	Admin/Oper	Address/Mask	Node	Port
				-
node1_clus1	up/up	169.254.209.69/16	node1	e0a
node1_clus2	up/up	169.254.49.125/16	node1	e0b
node2_clus1	up/up	169.254.47.194/16	node2	e0a
node2 clus2	up/up	169.254.19.183/16	node2	e0b
	Interface node1_clus1 node1_clus2 node2_clus1	Interface Admin/Oper   node1_clus1 up/up  node1_clus2 up/up  node2_clus1 up/up	Interface Admin/Oper Address/Mask   node1_clus1 up/up 169.254.209.69/16  node1_clus2 up/up 169.254.49.125/16  node2_clus1 up/up 169.254.47.194/16	Interface Admin/Oper Address/Mask Node   node1_clus1 up/up 169.254.209.69/16 node1  node1_clus2 up/up 169.254.49.125/16 node1  node2_clus1 up/up 169.254.47.194/16 node2  node2_clus2 up/up 169.254.19.183/16 node2

3. Verify that both nodes each have one connection to each switch:

show cdp neighbors

# Show example The following example shows the appropriate results for both switches:

# (cs1) # show cdp neighbors

Capability Codes: R - Router, T - Trans-Bridge, B - Source-Route-Bridge

S - Switch, H - Host, I - IGMP, r - Repeater,
V - VoIP-Phone, D - Remotely-Managed-Device,

s - Supports-STP-Dispute

Device-ID	Local Intrfce	Hldtme	Capability	Platform
Port ID				
node1	Eth1/1	133	Н	FAS2980
e0a				
node2	Eth1/2	133	Н	FAS2980
e0a		455		
cs2(FD0220329V5)	Eth1/65	175	RSIs	N9K-C92300YC
Eth1/65	E+b1/66	175	D C T ~	NOT COSSOS
cs2(FD0220329V5)	Eth1/66	175	RSIs	N9K-C92300YC
Eth1/66				

Total entries displayed: 4

# (cs2) # show cdp neighbors

Capability Codes: R - Router, T - Trans-Bridge, B - Source-Route-Bridge

S - Switch, H - Host, I - IGMP, r - Repeater,

V - VoIP-Phone, D - Remotely-Managed-Device,

s - Supports-STP-Dispute

Device-ID Port ID	Local Intrfce	Hldtme	Capability	Platform
node1	Eth1/1	133	Н	FAS2980
e0b node2	Eth1/2	133	Н	FAS2980
e0b cs1(FD0220329KU)				
Eth1/65	Eth1/65	175	RSIS	N9K-C92300YC
cs1(FD0220329KU)	Eth1/66	175	RSIs	N9K-C92300YC
Eth1/66	, , , ,	-		

Total entries displayed: 4

4. Display information about the discovered network devices in your cluster:

network device-discovery show -protocol cdp

# Show example

		Discovered		
Protocol	Port	Device (LLDP: ChassisID)	Interface	
Platform				
				_
node2	/cdp			
	e0a	cs1	0/2	N9K-
C92300YC				
	e0b	cs2	0/2	N9K-
C92300YC				
node1	/cdp			
	e0a	cs1	0/1	N9K-
C92300YC				
	e0b	cs2	0/1	N9K-
C92300YC				

5. Verify that the settings are disabled:

network options switchless-cluster show

It might take several minutes for the command to complete. Wait for the '3 minute lifetime to expire' announcement.

# Show example

The false output in the following example shows that the configuration settings are disabled:

```
cluster1::*> network options switchless-cluster show
Enable Switchless Cluster: false
```

6. Verify the status of the node members in the cluster:

cluster show

The following example shows information about the health and eligibility of the nodes in the cluster:

```
Node Health Eligibility Epsilon
-----
nodel true true false
node2 true true false
```

7. Verify that the cluster network has full connectivity:

cluster ping-cluster -node node-name

# Show example

```
cluster1::> cluster ping-cluster -node node2
Host is node2
Getting addresses from network interface table...
Cluster node1 clus1 169.254.209.69 node1 e0a
Cluster node1 clus2 169.254.49.125 node1 e0b
Cluster node2 clus1 169.254.47.194 node2 e0a
Cluster node2 clus2 169.254.19.183 node2 e0b
Local = 169.254.47.194 169.254.19.183
Remote = 169.254.209.69 169.254.49.125
Cluster Vserver Id = 4294967293
Ping status:
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
Detected 9000 byte MTU on 4 path(s):
Local 169.254.47.194 to Remote 169.254.209.69
Local 169.254.47.194 to Remote 169.254.49.125
Local 169.254.19.183 to Remote 169.254.209.69
Local 169.254.19.183 to Remote 169.254.49.125
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

8. If you suppressed automatic case creation, reenable it by invoking an AutoSupport message:

 $\verb|system| node autosupport invoke -node * -type all -message MAINT=END| \\$ 

# Show example

cluster1::\*> system node autosupport invoke -node \* -type all
-message MAINT=END

9. Change the privilege level back to admin:

set -privilege admin

10. For ONTAP 9.4 and later, enable the cluster switch health monitor log collection feature for collecting switch-related log files, using the commands:

 $\verb|system| cluster-switch| log| setup-password| \verb|and| system| cluster-switch| log| enable-collection|$ 

```
cluster1::*> system cluster-switch log setup-password
Enter the switch name: <return>
The switch name entered is not recognized.
Choose from the following list:
cs1
cs2
cluster1::*> system cluster-switch log setup-password
Enter the switch name: cs1
RSA key fingerprint is
e5:8b:c6:dc:e2:18:18:09:36:63:d9:63:dd:03:d9:cc
Do you want to continue? {y|n}::[n] y
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system cluster-switch log setup-password
Enter the switch name: cs2
RSA key fingerprint is
57:49:86:a1:b9:80:6a:61:9a:86:8e:3c:e3:b7:1f:b1
Do you want to continue? {y|n}:: [n] y
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system cluster-switch log enable-collection
Do you want to enable cluster log collection for all nodes in the
cluster?
{y|n}: [n] y
Enabling cluster switch log collection.
cluster1::*>
```

If any of these commands return an error, contact NetApp support.

# Migrate from a Cisco switch to a Cisco Nexus 92300YC switch

You can migrate nondisruptively older Cisco cluster switches for an ONTAP cluster to

# Cisco Nexus 92300YC cluster network switches.

After your migration completes, you might need to install the required configuration file to support the Cluster Switch Health Monitor (CSHM) for 92300YC cluster switches. See Install the Cluster Switch Health Monitor (CSHM).

# **Review requirements**

# What you'll need

- · A fully functional existing cluster.
- 10 GbE and 40 GbE connectivity from nodes to Nexus 92300YC cluster switches.
- All cluster ports are in the up state to ensure nondisruptive operations.
- Proper version of NX-OS and reference configuration file (RCF) installed on the Nexus 92300YC cluster switches.
- A redundant and fully functional NetApp cluster using both older Cisco switches.
- Management connectivity and console access to both the older Cisco switches and the new switches.
- All cluster LIFs in the up state with the cluster LIFs are on their home ports.
- ISL ports enabled and cabled between the older Cisco switches and between the new switches.

# Migrate the switch

# About the examples

The examples in this procedure use the following switch and node nomenclature:

- The existing Cisco Nexus 5596UP cluster switches are c1 and c2.
- The new Nexus 92300YC cluster switches are cs1 and cs2.
- The nodes are node1 and node2.
- The cluster LIFs are node1\_clus1 and node1\_clus2 on node 1, and node2\_clus1 and node2\_clus2 on node 2 respectively.
- Switch c2 is replaced by switch cs2 first and then switch c1 is replaced by switch cs1.
  - A temporary ISL is built on cs1 connecting c1 to cs1.
  - Cabling between the nodes and c2 are then disconnected from c2 and reconnected to cs2.
  - Cabling between the nodes and c1 are then disconnected from c1 and reconnected to cs1.
  - The temporary ISL between c1 and cs1 is then removed.

# Ports used for connections

- Some of the ports are configured on Nexus 92300YC switches to run at 10 GbE or 40 GbE.
- The cluster switches use the following ports for connections to nodes:
  - Ports e1/1-48 (10/25 GbE), e1/49-64 (40/100 GbE): Nexus 92300YC
  - Ports e1/1-40 (10 GbE): Nexus 5596UP
  - Ports e1/1-32 (10 GbE): Nexus 5020
  - Ports e1/1-12, e2/1-6 (10 GbE): Nexus 5010 with expansion module
- The cluster switches use the following Inter-Switch Link (ISL) ports:

- · Ports e1/65-66 (100 GbE): Nexus 92300YC
- Ports e1/41-48 (10 GbE): Nexus 5596UP
- Ports e1/33-40 (10 GbE): Nexus 5020
- Ports e1/13-20 (10 GbE): Nexus 5010
- Hardware Universe Switches contains information about supported cabling for all cluster switches.
- The ONTAP and NX-OS versions supported in this procedure are on the Cisco Ethernet Switches page.

# Step 1: Prepare for migration

1. Change the privilege level to advanced, entering **y** when prompted to continue:

```
set -privilege advanced
```

The advanced prompt (\*>) appears.

2. If AutoSupport is enabled on this cluster, suppress automatic case creation by invoking an AutoSupport message:

```
system node autosupport invoke -node * -type all -message MAINT=xh
```

where x is the duration of the maintenance window in hours.

The AutoSupport message notifies technical support of this maintenance task so that automatic case creation is suppressed during the maintenance window.

### Show example

The following command suppresses automatic case creation for two hours:

```
cluster1::*> system node autosupport invoke -node * -type all
-message MAINT=2h
```

3. Verify that auto-revert is enabled on all cluster LIFs:

network interface show -vserver Cluster -fields auto-revert

4. Determine the administrative or operational status for each cluster interface:

Each port should display up for Link and healthy for Health Status.

a. Display the network port attributes:

```
network port show -ipspace Cluster
```

de1					
					Speed(Mbps)
					- 1 / 6
	Broadcast	Domain	Link	M'I'U	Admin/Oper
Status 					
Cluster	Cluster		up	9000	auto/10000
false					
Cluster	Cluster		up	9000	auto/10000
false					
de2					
					Speed (Mbps)
Health					
IPspace	Broadcast	Domain	Link	MTU	Admin/Oper
Status					
	Cluster		up	9000	auto/10000
	Q1			0000	
Cluster	Cluster		up	9000	auto/10000
	Health IPspace Status Cluster false Cluster false de2  Health IPspace Status Cluster false	Health IPspace Broadcast Status Cluster Cluster false Cluster Cluster false de2  Health IPspace Broadcast Status Cluster Cluster	Health IPspace Broadcast Domain Status Cluster Cluster false Cluster Cluster false de2  Health IPspace Broadcast Domain Status Cluster Cluster false	Health IPspace Broadcast Domain Link Status  Cluster Cluster up false Cluster Cluster up false de2  Health IPspace Broadcast Domain Link Status  Cluster Cluster up false	Health IPspace Broadcast Domain Link MTU Status Cluster Cluster up 9000 false Cluster Cluster up 9000 false de2  Health IPspace Broadcast Domain Link MTU Status Cluster Cluster up 9000 false

b. Display information about the logical interfaces and their designated home nodes:

network interface show -vserver Cluster

Each LIF should display up/up for Status Admin/Oper and true for Is Home.

		Logical	Status	Network	Current
Current	Is				
Vserver		Interface	Admin/Oper	Address/Mask	Node
Port	Home	9			
Cluster					
		node1_clus1	up/up	169.254.209.69/16	node1
e0a	true	е			
		node1_clus2	up/up	169.254.49.125/16	node1
e0b	true	е			
		node2_clus1	up/up	169.254.47.194/16	node2
e0a	true	е			
		node2_clus2	up/up	169.254.19.183/16	node2
e0b	true	е			

5. Verify that the cluster ports on each node are connected to existing cluster switches in the following way (from the nodes' perspective) using the command:

network device-discovery show -protocol cdp

Node/	Local	Discovered		
Protocol	Port	Device (LLDP: ChassisID)	Interface	
Platform				
node2	/cdp			
	e0a	c1	0/2	N5K-
C5596UP				
	e0b	c2	0/2	N5K-
C5596UP				
node1	/cdp			
	e0a	c1	0/1	N5K-
C5596UP				
	e0b	c2	0/1	N5K-
C5596UP				

6. Verify that the cluster ports and switches are connected in the following way (from the switches' perspective) using the command:

show cdp neighbors

# 7. Verify that the cluster network has full connectivity using the command:

cluster ping-cluster -node node-name

```
cluster1::*> cluster ping-cluster -node node2
Host is node2
Getting addresses from network interface table...
Cluster node1 clus1 169.254.209.69 node1
                                              e0a
Cluster node1 clus2 169.254.49.125 node1
                                              e0b
Cluster node2 clus1 169.254.47.194 node2
                                              e0a
Cluster node2 clus2 169.254.19.183 node2
                                              e0b
Local = 169.254.47.194 169.254.19.183
Remote = 169.254.209.69 169.254.49.125
Cluster Vserver Id = 4294967293
Ping status:
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
. . . . . . . . . . . . . . . . . . .
Detected 9000 byte MTU on 4 path(s):
    Local 169.254.19.183 to Remote 169.254.209.69
    Local 169.254.19.183 to Remote 169.254.49.125
    Local 169.254.47.194 to Remote 169.254.209.69
    Local 169.254.47.194 to Remote 169.254.49.125
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

# Step 2: Configure cables and ports

1. Configure a temporary ISL on cs1on ports e1/41-48, between c1 and cs1.

The following example shows how the new ISL is configured on c1 and cs1:

```
cs1# configure
Enter configuration commands, one per line. End with CNTL/Z.
cs1(config) # interface e1/41-48
cs1(config-if-range)# description temporary ISL between Nexus 5596UP
and Nexus 92300YC
cs1(config-if-range)# no lldp transmit
cs1(config-if-range)# no lldp receive
cs1(config-if-range)# switchport mode trunk
cs1(config-if-range)# no spanning-tree bpduguard enable
cs1(config-if-range) # channel-group 101 mode active
cs1(config-if-range)# exit
cs1(config) # interface port-channel 101
cs1(config-if) # switchport mode trunk
cs1(config-if) # spanning-tree port type network
cs1(config-if)# exit
cs1(config)# exit
```

- 2. Remove ISL cables from ports e1/41-48 from c2 and connect the cables to ports e1/41-48 on cs1.
- 3. Verify that the ISL ports and port-channel are operational connecting c1 and cs1:

```
show port-channel summary
```

# Show example The following example shows the Cisco show port-channel summary command being used to verify the ISL ports are operational on c1 and cs1:

```
c1# show port-channel summary
Flags: D - Down P - Up in port-channel (members)
       I - Individual H - Hot-standby (LACP only)
       s - Suspended r - Module-removed

Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system cluster-switch log enable-collection
Do you want to enable cluster log collection for all nodes in the
cluster?
{y|n}: [n] y
Enabling cluster switch log collection.
cluster1::*>
```

If any of these commands return an error, contact NetApp support.

# Replace switches

# Replace a Cisco Nexus 92300YC switch

Replacing a defective Nexus 92300YC switch in a cluster network is a nondisruptive procedure (NDU).

# **Review requirements**

# What you'll need

Before performing the switch replacement, ensure that:

- In the existing cluster and network infrastructure:
  - The existing cluster is verified as completely functional, with at least one fully connected cluster switch.
  - · All cluster ports are up.
  - All cluster logical interfaces (LIFs) are up and on their home ports.
  - The ONTAP cluster ping-cluster -node node1 command must indicate that basic connectivity and larger than PMTU communication are successful on all paths.
- For the Nexus 92300YC replacement switch:
  - Management network connectivity on the replacement switch are functional.
  - · Console access to the replacement switch are in place.
  - The node connections are ports 1/1 through 1/64.
  - All Inter-Switch Link (ISL) ports are disabled on ports 1/65 and 1/66.
  - The desired reference configuration file (RCF) and NX-OS operating system image switch are loaded onto the switch.
  - Initial customization of the switch are complete, as detailed in: Configure the Cisco Nexus 92300YC switch.

Any previous site customizations, such as STP, SNMP, and SSH, are copied to the new switch.

# Replace the switch

# About the examples

The examples in this procedure use the following switch and node nomenclature:

- The names of the existing Nexus 92300YC switches are cs1 and cs2.
- The name of the new Nexus 92300YC switch is newcs2.
- The node names are node1 and node2.
- The cluster ports on each node are named e0a and e0b.
- The cluster LIF names are node1\_clus1 and node1\_clus2 for node1, and node2\_clus1 and node2\_clus2 for node2.
- The prompt for changes to all cluster nodes is cluster1::\*>

# About this task

You must execute the command for migrating a cluster LIF from the node where the cluster LIF is hosted.

e following procedure is based on the following cluster network topology:	

-1	. +>			<b>61</b>	<b>.</b>		
clusterl:	:*> network p	ort show -1	pspace	Clus	ter

# Step 1: Prepare for replacement

1. Install the appropriate RCF and image on the switch, newcs2, and make any necessary site preparations.

If necessary, verify, download, and install the appropriate versions of the RCF and NX-OS software for the new switch. If you have verified that the new switch is correctly set up and does not need updates to the RCF and NX-OS software, continue to step 2.

- a. Go to the NetApp Cluster and Management Network Switches Reference Configuration File Description Page on the NetApp Support Site.
- b. Click the link for the *Cluster Network and Management Network Compatibility Matrix*, and then note the required switch software version.
- c. Click your browser's back arrow to return to the **Description** page, click **CONTINUE**, accept the license agreement, and then go to the **Download** page.
- d. Follow the steps on the Download page to download the correct RCF and NX-OS files for the version of ONTAP software you are installing.
- 2. On the new switch, log in as admin and shut down all of the ports that will be connected to the node cluster interfaces (ports 1/1 to 1/64).

If the switch that you are replacing is not functional and is powered down, go to Step 4. The LIFs on the cluster nodes should have already failed over to the other cluster port for each node.

```
newcs2# config
Enter configuration commands, one per line. End with CNTL/Z.
newcs2(config)# interface e1/1-64
newcs2(config-if-range)# shutdown
```

3. Verify that all cluster LIFs have auto-revert enabled:

network interface show -vserver Cluster -fields auto-revert

# Show example

4. Verify that all the cluster LIFs can communicate:

cluster ping-cluster

```
cluster1::*> cluster ping-cluster node1
Host is node2
Getting addresses from network interface table...
Cluster node1 clus1 169.254.209.69 node1 e0a
Cluster node1 clus2 169.254.49.125 node1 e0b
Cluster node2 clus1 169.254.47.194 node2 e0a
Cluster node2 clus2 169.254.19.183 node2 e0b
Local = 169.254.47.194 169.254.19.183
Remote = 169.254.209.69 169.254.49.125
Cluster Vserver Id = 4294967293
Ping status:
. . . .
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
. . . . . . . . . . . . . . . . . . .
Detected 9000 byte MTU on 4 path(s):
Local 169.254.47.194 to Remote 169.254.209.69
Local 169.254.47.194 to Remote 169.254.49.125
Local 169.254.19.183 to Remote 169.254.209.69
Local 169.254.19.183 to Remote 169.254.49.125
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

# Step 2: Configure cables and ports

1. Shut down the ISL ports 1/65 and 1/66 on the Nexus 92300YC switch cs1:

# Show example

```
csl# configure
Enter configuration commands, one per line. End with CNTL/Z.
csl(config)# interface e1/65-66
csl(config-if-range)# shutdown
csl(config-if-range)#
```

2. Remove all of the cables from the Nexus 92300YC cs2 switch, and then connect them to the same ports on the Nexus 92300YC newcs2 switch.

3. Bring up the ISLs ports 1/65 and 1/66 between the cs1 and newcs2 switches, and then verify the port channel operation status.

Port-Channel should indicate Po1(SU) and Member Ports should indicate Eth1/65(P) and Eth1/66(P).

# Show example

This example enables ISL ports 1/65 and 1/66 and displays the port channel summary on switch cs1:

```
cs1# configure
Enter configuration commands, one per line. End with CNTL/Z.
cs1(config) # int e1/65-66
cs1(config-if-range) # no shutdown
cs1(config-if-range)# show port-channel summary
Flags: D - Down P - Up in port-channel (members)
       I - Individual H - Hot-standby (LACP only)
       s - Suspended r - Module-removed
       b - BFD Session Wait
       S - Switched R - Routed
       U - Up (port-channel)
       p - Up in delay-lacp mode (member)
       M - Not in use. Min-links not met
_____
Group Port- Type Protocol Member Ports
     Channel
1 Po1(SU) Eth LACP Eth1/65(P) Eth1/66(P)
cs1(config-if-range)#
```

4. Verify that port e0b is up on all nodes:

network port show ipspace Cluster

The output should be similar to the following:

```
cluster1::*> network port show -ipspace Cluster
Node: node1
Ignore
                                  Speed (Mbps)
Health Health
Port IPspace Broadcast Domain Link MTU Admin/Oper
Status Status
_____ ____
   Cluster Cluster up 9000 auto/10000
healthy false
e0b Cluster Cluster up 9000 auto/10000
healthy false
Node: node2
Ignore
                                  Speed (Mbps)
Health Health
Port IPspace Broadcast Domain Link MTU Admin/Oper
Status Status
-----
e0a Cluster Cluster up 9000 auto/10000
healthy false
   Cluster Cluster up 9000 auto/auto
e0b
false
4 entries were displayed.
```

5. On the same node you used in the previous step, revert the cluster LIF associated with the port in the previous step by using the network interface revert command.

In this example, LIF node1\_clus2 on node1 is successfully reverted if the Home value is true and the port is e0b.

The following commands return LIF node1\_clus2 on node1 to home port e0a and displays information about the LIFs on both nodes. Bringing up the first node is successful if the Is Home column is true for both cluster interfaces and they show the correct port assignments, in this example e0a and e0b on node1.

```
cluster1::*> network interface show -vserver Cluster
         Logical Status Network Current
Current Is
Vserver Interface Admin/Oper Address/Mask Node
Port Home
______ ____ ____
_____
Cluster
        node1 clus1 up/up 169.254.209.69/16 node1
e0a
     true
        node1 clus2 up/up 169.254.49.125/16 node1
e0b
     true
         node2 clus1 up/up 169.254.47.194/16 node2
e0a
     true
         node2 clus2 up/up 169.254.19.183/16 node2
     false
e0a
4 entries were displayed.
```

# 6. Display information about the nodes in a cluster:

cluster show

# Show example

This example shows that the node health for node1 and node2 in this cluster is true:

```
Cluster1::*> cluster show

Node Health Eligibility
-----
node1 false true
node2 true true
```

7. Verify that all physical cluster ports are up:

network port show ipspace Cluster

# Show example

Node: no	del

Do you want to continue? {y|n}:: [n] y
Enter the password: <enter switch password>
Enter the password again: <enter switch password>
cluster1::*> system cluster-switch log enable-collection
Do you want to enable cluster log collection for all nodes in the
cluster?
{y|n}: [n] y
Enabling cluster switch log collection.
cluster1::*>
```

If any of these commands return an error, contact NetApp support.

# Replace Cisco Nexus 92300YC cluster switches with switchless connections

You can migrate from a cluster with a switched cluster network to one where two nodes

are directly connected for ONTAP 9.3 and later.

### **Review requirements**

#### **Guidelines**

Review the following guidelines:

- Migrating to a two-node switchless cluster configuration is a nondisruptive operation. Most systems have
  two dedicated cluster interconnect ports on each node, but you can also use this procedure for systems
  with a larger number of dedicated cluster interconnect ports on each node, such as four, six or eight.
- You cannot use the switchless cluster interconnect feature with more than two nodes.
- If you have an existing two-node cluster that uses cluster interconnect switches and is running ONTAP 9.3 or later, you can replace the switches with direct, back-to-back connections between the nodes.

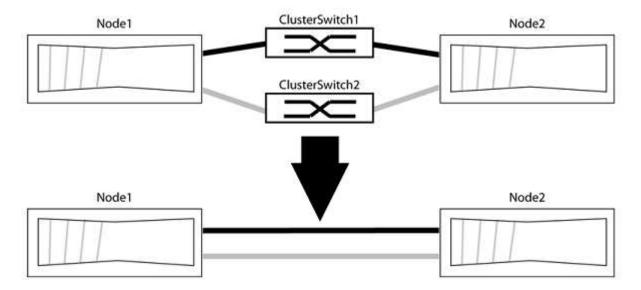

# What you'll need

- A healthy cluster that consists of two nodes connected by cluster switches. The nodes must be running the same ONTAP release.
- Each node with the required number of dedicated cluster ports, which provide redundant cluster interconnect connections to support your system configuration. For example, there are two redundant ports for a system with two dedicated cluster interconnect ports on each node.

### Migrate the switches

#### About this task

The following procedure removes the cluster switches in a two-node cluster and replaces each connection to the switch with a direct connection to the partner node.

#### About the examples

The examples in the following procedure show nodes that are using "e0a" and "e0b" as cluster ports. Your nodes might be using different cluster ports as they vary by system.

### Step 1: Prepare for migration

1. Change the privilege level to advanced, entering y when prompted to continue:

```
set -privilege advanced
```

The advanced prompt \*> appears.

2. ONTAP 9.3 and later supports automatic detection of switchless clusters, which is enabled by default.

You can verify that detection of switchless clusters is enabled by running the advanced privilege command:

```
network options detect-switchless-cluster show
```

### Show example

The following example output shows if the option is enabled.

```
cluster::*> network options detect-switchless-cluster show
  (network options detect-switchless-cluster show)
Enable Switchless Cluster Detection: true
```

If "Enable Switchless Cluster Detection" is false, contact NetApp support.

If AutoSupport is enabled on this cluster, suppress automatic case creation by invoking an AutoSupport message:

```
system node autosupport invoke -node * -type all -message MAINT=<number of hours>h \,
```

where h is the duration of the maintenance window in hours. The message notifies technical support of this maintenance task so that they can suppress automatic case creation during the maintenance window.

In the following example, the command suppresses automatic case creation for two hours:

# Show example

```
cluster::*> system node autosupport invoke -node * -type all
-message MAINT=2h
```

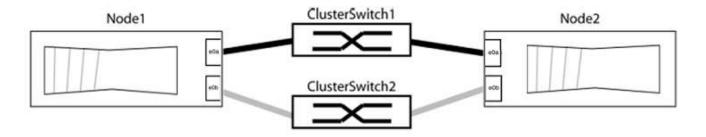

## Step 2: Configure ports and cabling

- 1. Organize the cluster ports on each switch into groups so that the cluster ports in group1 go to cluster switch1 and the cluster ports in group2 go to cluster switch2. These groups are required later in the procedure.
- 2. Identify the cluster ports and verify link status and health:

```
network port show -ipspace Cluster
```

In the following example for nodes with cluster ports "e0a" and "e0b", one group is identified as "node1:e0a" and "node2:e0a" and the other group as "node1:e0b" and "node2:e0b". Your nodes might be

using different cluster ports because they vary by system.

Verify that the ports have a value of up for the "Link" column and a value of healthy for the "Health Status" column.

## Show example

Ignore							
Health						Speed (Mbps)	Health
	Pspace	Broadcast	Domain	Link	МТП	Admin/Oper	Status
Status	155400	Diodacase	Domain		1110	riamiri, oper	
e0a C	luster	Cluster		up	9000	auto/10000	healthy
false							
	luster	Cluster		up	9000	auto/10000	healthy
false							
Node: n	ode2						
Ignore							
						Speed(Mbps)	Health
Health							
	Pspace	Broadcast	Domain	Link	MTU	Admin/Oper	Status
Status							
e0a C	luster	Cluster		up	9000	auto/10000	healthv
false				. 1			1
	luster	01			0000	auto/10000	1 7.1

3. Confirm that all the cluster LIFs are on their home ports.

Verify that the "is-home" column is true for each of the cluster LIFs:

network interface show -vserver Cluster -fields is-home

### Show example

If there are cluster LIFs that are not on their home ports, revert those LIFs to their home ports:

```
network interface revert -vserver Cluster -lif *
```

4. Disable auto-revert for the cluster LIFs:

```
network interface modify -vserver Cluster -lif * -auto-revert false
```

5. Verify that all ports listed in the previous step are connected to a network switch:

```
network device-discovery show -port cluster port
```

The "Discovered Device" column should be the name of the cluster switch that the port is connected to.

#### Show example

The following example shows that cluster ports "e0a" and "e0b" are correctly connected to cluster switches "cs1" and "cs2".

```
cluster::> network device-discovery show -port e0a|e0b
  (network device-discovery show)
        Local Discovered
Node/
                Device (LLDP: ChassisID) Interface Platform
Protocol Port
node1/cdp
                                                    BES-53248
         e0a cs1
                                          0/11
                                          0/12
                                                    BES-53248
         e0b cs2
node2/cdp
         e0a
             cs1
                                          0/9
                                                    BES-53248
         e0b
                                          0/9
                cs2
                                                    BES-53248
4 entries were displayed.
```

6. Verify the cluster connectivity:

```
cluster ping-cluster -node local
```

7. Verify that the cluster is healthy:

```
cluster ring show
```

All units must be either master or secondary.

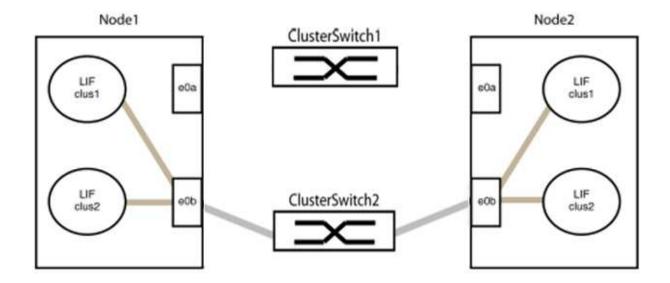

8. Set up the switchless configuration for the ports in group 1.

To avoid potential networking issues, you must disconnect the ports from group1 and reconnect them back-to-back as quickly as possible, for example, **in less than 20 seconds**.

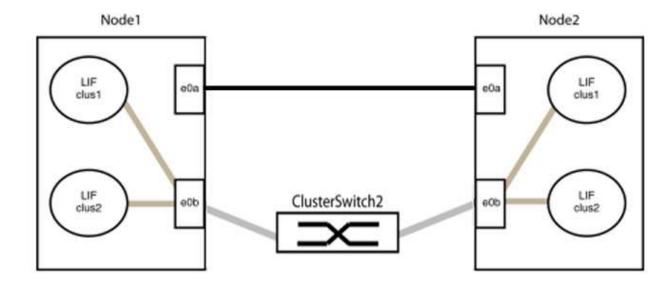

a. Disconnect all the cables from the ports in group1 at the same time.

In the following example, the cables are disconnected from port "e0a" on each node, and cluster traffic continues through the switch and port "e0b" on each node:

b. Cable the ports in group1 back-to-back.

In the following example, "e0a" on node1 is connected to "e0a" on node2:

9. The switchless cluster network option transitions from false to true. This might take up to 45 seconds. Confirm that the switchless option is set to true:

network options switchless-cluster show

The following example shows that the switchless cluster is enabled:

cluster::\*> network options switchless-cluster show
Enable Switchless Cluster: true

10. Verify that the cluster network is not disrupted:

cluster ping-cluster -node local

Before proceeding to the next step, you must wait at least two minutes to confirm a working back-to-back connection on group 1.

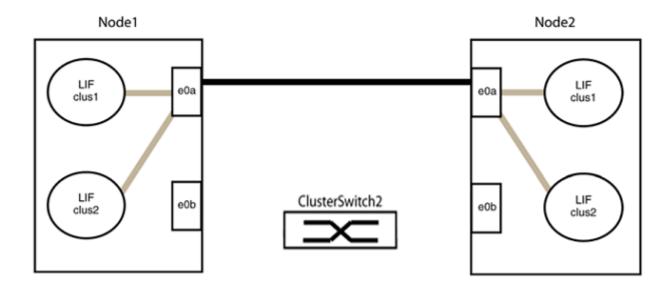

11. Set up the switchless configuration for the ports in group 2.

To avoid potential networking issues, you must disconnect the ports from group2 and reconnect them back-to-back as quickly as possible, for example, **in less than 20 seconds**.

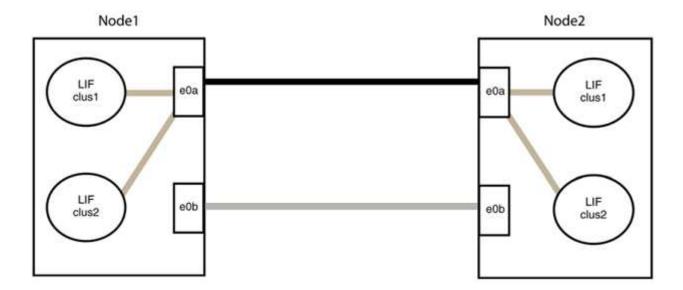

a. Disconnect all the cables from the ports in group2 at the same time.

In the following example, the cables are disconnected from port "e0b" on each node, and cluster traffic continues through the direct connection between the "e0a" ports:

b. Cable the ports in group2 back-to-back.

In the following example, "e0a" on node1 is connected to "e0a" on node2 and "e0b" on node1 is connected to "e0b" on node2:

### Step 3: Verify the configuration

1. Verify that the ports on both nodes are correctly connected:

```
network device-discovery show -port cluster port
```

### Show example

The following example shows that cluster ports "e0a" and "e0b" are correctly connected to the corresponding port on the cluster partner:

```
cluster::> net device-discovery show -port e0a|e0b
  (network device-discovery show)
        Local Discovered
Node/
Protocol Port Device (LLDP: ChassisID) Interface Platform
node1/cdp
          e0a node2
                                          e0a
                                                   AFF-A300
          e0b node2
                                          e0b AFF-A300
node1/lldp
          e0a node2 (00:a0:98:da:16:44) e0a
e0b node2 (00:a0:98:da:16:44) e0b
node2/cdp
          e0a node1
                                          e0a
                                                    AFF-A300
          e0b
                node1
                                          e0b
                                                    AFF-A300
node2/11dp
               node1 (00:a0:98:da:87:49) e0a
          e0a
          e0b node1 (00:a0:98:da:87:49) e0b
8 entries were displayed.
```

2. Re-enable auto-revert for the cluster LIFs:

```
network interface modify -vserver Cluster -lif * -auto-revert true
```

3. Verify that all LIFs are home. This might take a few seconds.

```
network interface show -vserver Cluster -lif lif name
```

#### Show example

The LIFs have been reverted if the "Is Home" column is true, as shown for node1\_clus2 and node2\_clus2 in the following example:

If any cluster LIFS have not returned to their home ports, revert them manually from the local node:

```
network interface revert -vserver Cluster -lif lif name
```

4. Check the cluster status of the nodes from the system console of either node:

cluster show

#### Show example

The following example shows epsilon on both nodes to be false:

5. Confirm connectivity between the cluster ports:

```
cluster ping-cluster local
```

6. If you suppressed automatic case creation, reenable it by invoking an AutoSupport message:

```
system node autosupport invoke -node * -type all -message MAINT=END
```

For more information, see NetApp KB Article 1010449: How to suppress automatic case creation during scheduled maintenance windows.

7. Change the privilege level back to admin:
